

## PRESS RELEASE

### ResearchPool launches new data collection and management solution for the buy-side

*3 February 2022, Paris*

ResearchPool, the innovative investment research and data solutions provider, announces today the launch of a new tool for enterprise customers that will allow buy-side firms to aggregate fragmented, locally stored data - such as environmental, social and governance (ESG), proprietary or fundamental data, often saved in multiple formats, such as spreadsheets, emails, and PDFs - into a single firm-wide, cloud-based hub.

Investment managers currently face an overwhelming deluge of data, particularly with the rise of ESG investing. Therefore, many firms are looking to solve a range of data issues that have been caused by legacy systems, fragmented data, and degraded operating models, all of which hinder effective investment decision making, add costs, and creates poor user experience.

Responding to our clients' needs, ResearchPool has developed a solution that allows a firm to quickly create from scratch their own databases on our secure platform, without coding or internal IT support, enabling them to seamlessly centralise, standardise, analyse, and share external and internal data in a wide variety of formats.

ResearchPool has embedded Tableau™, visual data analytics platform, to transform how organisations then see and understand their data.

Pedro Fernandes, Co-Founder & CEO of ResearchPool, said:

“At ResearchPool we recognise that accurate, standardised, transparent, and timely data managed through an efficient workflow is essential for successful and repeatable investment decision making. Our data collection and management solution enables buy-side firms to consolidate their proprietary data in the cloud helping to transform their data into an asset.”
